

Where The Evidence Lives

PROOF MAP

The app does not pretend everything is inside one database.
Each layer has a job.

How Gil Remembers

MEMORY MAP

Static tournament knowledge is global. User shame is wallet-scoped. Both are recallable.

Static / Global Memory

shared by everyone

- World Cup 2026 fixture schedule.
- Groups, venues, kickoff locks, result updates.
- Team profiles: coach, flag, squad list.
- Player roast traits for famous football habits.
- Updated when results, postponements, or knockout fixtures change.

User / Wallet Memory

one namespace per wallet

- Chat history and favorite teams.
- Prediction behavior and previous bad takes.
- Roasts Gil already delivered.
- Notebook recall for the connected Sui address.
- Used to make day-N Gil more personal than day-1 Gil.

Signed action lifecycle

1. Connect

Sui wallet proves identity.

2. Sign

Prediction or output action is wallet-gated.

3. Store

Walrus Memory or Blob keeps the data.

4. Anchor

Sui object records hash, pointer, or score.

5. Roast

Gil recalls it later and cites the mess.

Prediction actions sign a Sui transaction. Chat/roast/notebook actions require verified wallet session; important generated outputs can be stored as Walrus blob payloads and anchored by Sui OutputRecord.
