

Gil's VAR Shamebook

ROASTED
SYSTEM
DESIGN

A fun prediction game where Gil remembers picks, fixture questions, team profiles, and roastable mistakes through Walrus-backed memory.

SUBMISSION ARCHITECTURE

WHAT THIS APP PROVES

The product is not a static chatbot. It has signed user actions, on-chain prediction gates, Walrus Memory recall, Walrus Blob payloads, and public tracking links.

Supabase is only the fast index. The durable story belongs to Walrus and Sui.

Gil can forget the score. Walrus cannot forget the receipt.

SYSTEM CANVAS

WALLET + WEB

React app on Walrus Sites. Wallet signs picks and proof records.

GIL API

Vercel Node API runs tools, Gemini, recall, and output anchoring.

SUI + WALRUS

Sui stores receipts. Walrus stores media, payloads, and recall.

TRACKING UI

Judges inspect object IDs, blob pointers, memory namespaces, and API status.

DAILY WHAT'S UP

Six-role newsroom workflow writes dispatches with editorial memory and novelty proof.

W Wallet Session

Connects Sui identity, detects network, signs transaction intents, and anchors output proof objects.

UI React SPA

Newspaper-style interface for Gil chat, prediction desk, leaderboard, gallery, profile pages, and tracking.

G Gil Agent

Uses fixture/profile tools and Markdown plus typed JSON parts so answers render as real cards, not raw dumps.

M Walrus Memory

Global schedule memory and wallet notebooks let Gil answer fixed fixture questions and remember user history.

B Walrus Blob

Gallery art, team profile payloads, and generated output JSON can be inspected by blob pointer.

S Sui Objects

Prediction gates, settlement state, score records, and output hashes stay compact and public.

D Dispatch Pipeline

Orchestrator, scout, synthesizer, writer, moderator, and publisher produce traceable Daily What's Up posts.

Trace proof

How the memory spine works

Five clear paths power the demo: signed picks, chat answers, static World Cup memory, agentic dispatches, and public runtime tracking.

MAINNET PROOF

- Walrus Site object deployed on Mainnet.
- 104 fixtures registered in the Sui MatchRegistry.
- Team profiles and gallery media expose Walrus blob pointers.
- Daily What's Up exposes blob, memory namespace, Sui receipt, and novelty proof.
- Tracking page keeps proof links in one place.

STORAGE SPLIT

- Walrus Memory:** global schedule and wallet notebooks.
- Briefing Memory:** editorial memory for anti-repeat writing.
- Walrus Blob:** media, team data, generated payloads.
- Sui:** signed receipts, gate state, content hashes.
- Supabase:** rebuildable cache for fast UI reads.
