

# The Daily Walrus

World Cup 2026 predictions with memory, receipts, and public shame.

Judge Gil is an AI football pundit backed by Walrus Memory and Sui objects. He remembers fixtures, your wallet-linked takes, team profiles, player quirks, and the exact moment your prediction became comedy evidence.

**Judge Gil**

"I cannot remember... wait, Walrus already snitched."

## 1 Wallet-Gated Predictions

- Connect Sui wallet and sign in.
- Pick scoreline, MVP, worst player, champion, or advance.
- Only open matches can be predicted; kickoff locks the booth.

## 2 Walrus Memory Spine

- Global schedule memory for fixture Q&A.
- Team/player memory with squads, coaches, flags, and sources.
- User notebooks turn bad takes into reusable roast material.

## 3 Roasted Edition

- Gil roasts teams and players using official data.
- Player troll traits add texture: free-kick moons, hair checks, slow walks.
- Roast cards link back to output proof and Walrus blobs.

## 4 Proof, Not Vibes

- Sui objects: MatchRegistry, Prediction, Scoreboard, OutputRecord.
- Walrus blobs: team profiles, gallery assets, output payloads.
- Runtime Tracking page gives judges one-click audit links.

## 5 How One Bad Take Becomes Permanent Evidence

**Wallet**

signs identity + transaction

**Prediction**

writes Sui object before lock

**Oracle**

settles after result seed

**Gil**

remembers and roasts the receipt

## 6 System Structure

**React SPA**

chat, predictions, gallery, tracking

**Wallet**

Sui sign-in and tx execution

**Node API**

auth, oracle, Gil routes, indexer

**AI Runtime**

Gil persona + roast engine

**Walrus**

memory + blob proof

**Sui**

contracts + public receipts

Canonical memory lives on Walrus. Sui stores public gates and proof objects. Supabase is only a fast rebuildable index, not the source of truth.

NO TAKE LEFT BEHIND

Built for Walrus Memory World Cup. Mainnet deployment goes live after testnet verification and funded gas/WAL.
