

The Daily Walrus

testnet verified -> mainnet ready after funding

A wallet-gated World Cup 2026 prediction and roast app where Walrus Memory stores what Gil remembers, Sui objects prove what happened, and Supabase remains a rebuildable index.

System Layers and Ownership

LAYER	OWNS	INPUTS	OUTPUTS
React SPA	UI, i18n, wallet UX, settings, reference pages, gallery.	Wallet account, API snapshots, user input.	Transactions, REST calls, proof links.
Wallet / Sui Client	Sign-in messages, transaction execution, gas/network state.	Current account and Sui network.	Signatures, tx digests, object IDs.
Node API	Auth, Gil context assembly, memory calls, scoring, indexing, tracking.	Session token, oracle token, app payloads.	JSON DTOs, SSE snapshots, registered output rows.
AI Runtime	Gil persona, fixture Q&A, roast composition, severity/language controls.	User memory, global memory, team/player data.	Chat, roasts, notebook summaries.
Walrus Memory	Persistent recall store by namespace.	Global schedule docs, user events, player traits.	Recall chunks and memory receipts.
Sui Contract	Prediction gate, score proof, output receipts.	Wallet transactions and oracle transactions.	Public objects and events.
Walrus Blob	Immutable payload evidence and media assets.	Profile JSON, output JSON, gallery assets.	Blob IDs and object links.
Supabase Index	Fast UI reads and rebuildable state.	Sui events, Walrus pointers, server writes.	Leaderboard, fixture gates, tracking metadata.

Prediction Gate

- Match must be registered on-chain.
- Kickoff time must be in the future.
- Settled matches are permanently closed.

Memory Gate

- Personalized reads require verified wallet session.
- Global fixture memory is public app context.
- Output pointers are tracked for audit.

Mainnet Gate

- Publish Move package to Sui mainnet.
- Publish site/assets to Walrus mainnet.
- Replace testnet IDs in tracking and submission.

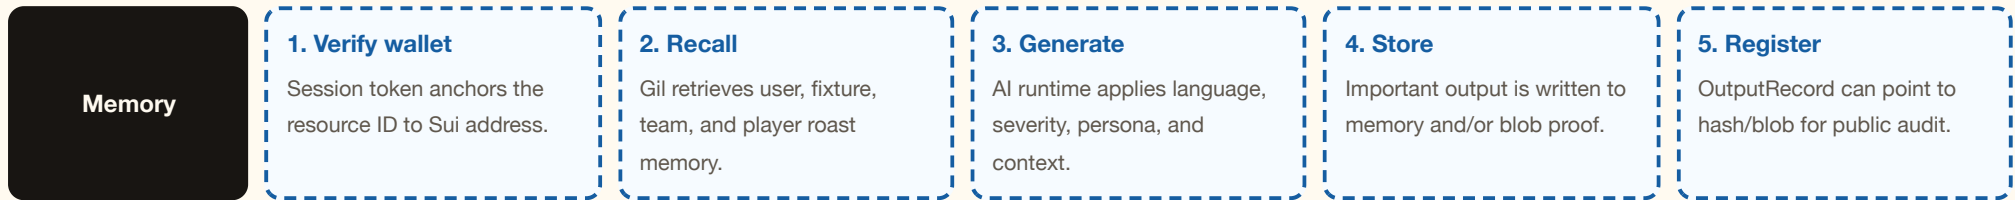

Runtime Paths Judges Can Verify

wallet -> memory -> proof

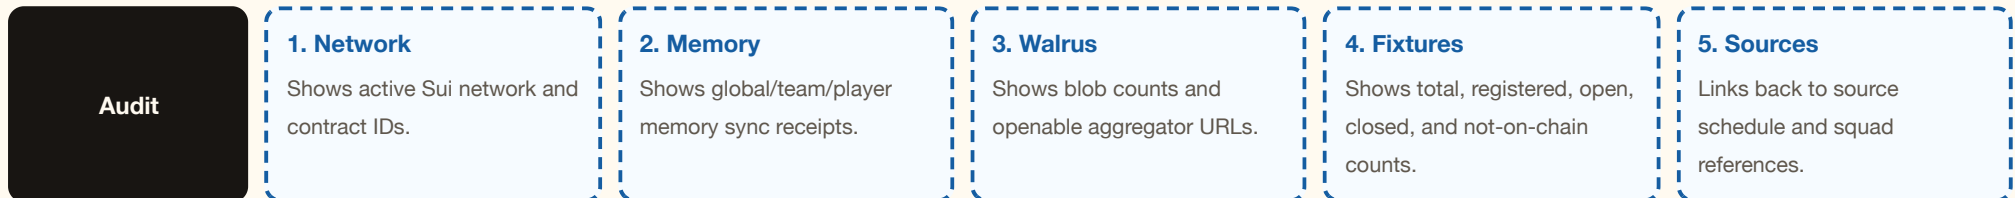

Prediction and Settlement

Chat / Roast / Notebook

Tracking Page

Browser test requirement: the app now exposes the current Sui network and checks wallet gas, so testnet wallets fail with an actionable faucet message instead of an opaque wallet popup error.

What Must Be Mainnet Before Final Form

Already Verified on Testnet

- 104/104 fixtures registered on-chain.
- Prediction submit, score, settle, and index replay verified.
- Global schedule memory and player roast memory synced.
- Runtime Tracking loads network, contract IDs, memory, blobs, and fixture gates.
- Web build succeeds for Walrus Sites packaging.

Mainnet Deployment Steps

- Fund deploy wallet with mainnet SUI gas and WAL.
- Publish Move package and record package, registry, scoreboard, cap IDs.
- Register all fixtures on mainnet and replay indexer.
- Publish team/player/profile/gallery blobs to Walrus mainnet.
- Deploy SPA to Walrus Sites and attach SuiNS / wal.app domain.

Submission Media

Poster PNG/PDF, screenshots for home/predictions/leaderboard/roasts/team profiles/gallery/notebook/tracking, and a sub-3-minute demo script.

Form Fields

Project name, introduction, repo URL, live Walrus URL, Sui/Walrus object IDs, memory namespaces, and judge verification notes.

Verification Note

Use `/api/tracking/runtime` and the Tracking page as the canonical public map from UI to contract objects, Walrus blobs, and memory receipts.

Current deploy state: local/testnet is healthy. Mainnet should not be submitted until the deploy wallet is funded and the final mainnet package, Walrus Site, blob, and memory IDs replace all testnet evidence.
